Catalog # MAB12792

Size 100 ug

Applications

Western Blot (Cell lysate)

Western Blot analysis of Lane 1: acid extracts of HeLa cell treated with Nocodazole and Lane 2: acid extracts of HeLa cell untreated with Histone H2A/H4 (phospho S1) monoclonal antibody, clone RM216 (Cat # MAB12792) at 0.5 ug/mL working concentration, showed a band of Histone H2A and H4 phosphorylated at Serine 1.

Immunocytochemistry

Immunocytochemistry of HeLa cells, using Histone H2A/H4 (phospho S1) monoclonal antibody, clone RM216 (Cat# MAB12792) (red). Actin filaments have been labeled with fluorescein phalloidin (green).

This product contains sodium azide: a POISONOUS AND HAZARDOUS SUBSTANCE which should be handled by trained staff only.

Gene Summary Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. Nucleosomes consist of approximately 146 bp of DNA wrapped around a histone octamer composed of pairs of each of the four core histones (H2A, H2B, H3, and H4). The chromatin fiber is further compacted through the interaction of a linker histone, H1, with the DNA between the nucleosomes to form higher order chromatin structures. This gene is intronless and encodes a member of the histone H2A family. Transcripts from this gene lack polyA tails; instead, they contain a palindromic termination element. This gene is found in the large histone gene cluster on chromosome 6p22-p21.3. [provided by RefSeq]
