Gene Summary	The protein encoded by this gene is a pleiotropic cytokine produced by activated T cells. This cyt okine is a ligand for interleukin 4 receptor. The interleukin 4 receptor also binds to IL13, which ma y contribute to many overlapping functions of this cytokine and IL13. STAT6, a signal transducer a nd activator of transcription, has been shown to play a central role in mediating the immune regula tory signal of this cytokine. This gene, IL3, IL5, IL13, and CSF2 form a cytokine gene cluster on ch romosome 5q, with this gene particularly close to IL13. This gene, IL13 and IL5 are found to be re gulated coordinately by several long-range regulatory elements in an over 120 kilobase range on t he chromosome. Two alternatively spliced transcript variants of this gene encoding distinct isofor ms have been reported. [provided by RefSeq
