# mutaFISH™ EGFR L858R L858wt Ex19wt RNA Probes

Catalog # FP0002 Size 1 Probe Set

## Applications

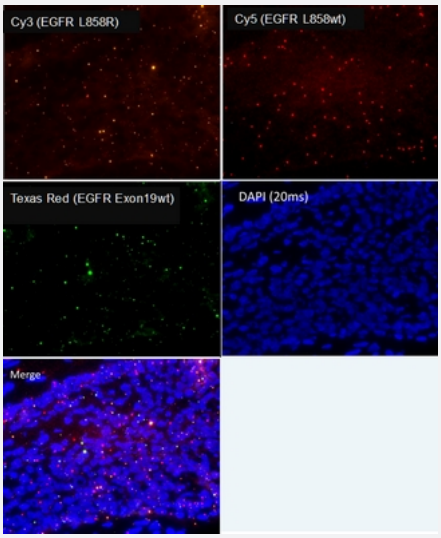

### mutation specific, Fluorescence *In Situ* Hybridization (Cells)

Fig.1 mutaFISH™ staining was performed *in situ* in human H1975 cells and with EpCAM immunostained via FITC. EGFR L858R point mutation was detected via orange signal (Cy3), EGFR L858wt was detected via red signal (Cy5), and EGFR Ex19wt was detected via green signal (FITC).

Fig. 2 mutaFISH™ staining was performed *in situ* in human PC-14 cells (white arrow) and with PanCK immunostained via FITC. EGFR L858R point mutation was not detected, EGFR L858wt was detected via red signal (Cy5), and EGFR Ex19wt was not detected.

# mutation specific, Fluorescence *In Situ* Hybridization (Frozen Tissue)

mutaFISH™ staining was performed *in situ* in human frozen tissue from lung adenocarcinoma. EGFR L858R point mutation was detected via orange signal (Cy3), EGFR L858wt was detected via red signal (Cy5), and EGFR Ex19wt was detected via green signal (Texas Red).

| **Gene Alias** | ERBB, ERBB1, HER1, PIG61, mENA |
| **Gene Description** | epidermal growth factor receptor (erythroblastic leukemia viral (v-erb-b) oncogene homolog, avian ) |
| **Omim ID** | 131550 211980 |
| **Gene Ontology** | Hyperlink |
| **Gene Summary** | The protein encoded by this gene is a transmembrane glycoprotein that is a member of the protei n kinase superfamily. This protein is a receptor for members of the epidermal growth factor family. EGFR is a cell surface protein that binds to epidermal growth factor. Binding of the protein to a lig and induces receptor dimerization and tyrosine autophosphorylation and leads to cell proliferation . Mutations in this gene are associated with lung cancer.
