Gene Summary	Interferon-gamma (IFNG), or type II interferon, is a cytokine critical for innate and adaptive immunit y against viral and intracellular bacterial infections and for tumor control. Aberrant IFNG expressio n is associated with a number of autoinflammatory and autoimmune diseases. The importance of IFNG in the immune system stems in part from its ability to inhibit viral replication directly, but mos t importantly derives from its immunostimulatory and immunomodulatory effects. IFNG is produce d predominantly by natural killer (NK) and natural killer T (NKT) cells as part of the innate immune r esponse, and by CD4 (MIM 186940) and CD8 (see MIM 186910) cytotoxic T lymphocyte (CTL) ef fector T cells once antigen-specific immunity develops (Schoenborn and Wilson, 2007 [PubMed 1 7981204]).[supplied by OMIM
