Gene Summary	This gene is one of several Cys-Cys (CC) cytokine genes clustered on the q arm of chromosome 17. Cytokines are a family of secreted proteins involved in immunoregulatory and inflammatory pr ocesses. The CC cytokines are proteins characterized by two adjacent cysteines. The cytokine e ncoded by this gene displays chemotactic activity for naive T cells, CD4+ and CD8+ T cells and n onactivated lymphocytes, but not for monocytes or granulocytes. This chemokine attracts naive T l ymphocytes toward dendritic cells and activated macrophages in lymph nodes. It may play a role i n both humoral and cell-mediated immunity responses.
