Gene Summary	The protein encoded by this gene belongs to the superfamily of small heat-shock proteins containi ng a conservative alpha-crystallin domain at the C-terminal part of the molecule. The expression o f this gene in induced by estrogen in estrogen receptor-positive breast cancer cells, and this prote in also functions as a chaperone in association with Bag3, a stimulator of macroautophagy. Thus, this gene appears to be involved in regulation of cell proliferation, apoptosis, and carcinogenesis, and mutations in this gene have been associated with different neuromuscular diseases, including Charcot-Marie-Tooth disease.
